is Sequence 19831, Application US/09252991A

is Sequence 19831, Application US/09252991A

is Patent No. 6551795

is Title OF INVENTION:

APPLICANT: Marc J. Rubenfield et al.

APPLICANTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERRINCE: 107196.136

CURRENT RILING DATE: 1998-02-18

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR PILING DATE: 1998-02-18

PRIOR PILING DATE: 1998-07-27

NUMBER: OF SEQ ID NOS: 33142

LENGTH: 477
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GENERAL INFORMATION:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Dreast cancer susceptibility protein BRCA2 - rat
C;Species: Rattus norvegicus (Norway rat)
C;Species: Rattus norvegicus (Norway rat)
C;Date: 03-Dec-1999 #sequence_revision 03-Dec-1999 #text_change 09-Jul-2004
C;Accession: T42207
R;MCAllister, K.A.; Haugen-Strano, A.; Hagevik, S.; Collins, N.K.; Brownlee, H.; Futreal, submitted to the EMBL Data Library, February 1997
A;Description: Characterization of the mouse and rat homologs of the BRCA2 breast cancer A;Rcference number: Z22073
A;Accession: T42207
A;Accession: T42207
A;Accession: T42207
A;Molecule type: mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A;Residues: 1-3343 <MCA>

```
The invention relates to full length GENSET human nucleic acids encoding potentially secreted proceins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and disgnosis of diseases associated with inappropriate GENSET gene expression. For gene expression by rectifying mutations or deletions in a patient genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense expression by binding with the cells' own genes and preventing their expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be used as DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; secreted protein; gene therapy; vaccine; treatment; diagnosis; GENSET.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Full length GENSET human nucleic acids encoding potentially secreted proteins, useful in gene therapy and vaccination against a variety of diseases, and for diagnosis of those diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bougueleret L, Jobert S;

probes in diagnostic assays to detect and quantitate the presence of shiltar nucleic acid sequences in samples, and hence to determine which patients may be in need of restorative therapy. The GENSET polypeptides may be used as antigens in the production of antibodies and in assays to expression and antigorists and antagonists) of GENSET polypeptide expression and activity. The present sequence is a GENSET polypeptide the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human polynucleotides and the polypeptides they encode. The polynucleotides and polypeptides are useful in diagnostics, corensics, gene mapping, medical imaging, identification of mutations responsible for genetic disorders or other traits, assessing biodiversity and producing many other types of data and products dependent on DNA and amino acid sequences. They are also useful for preventing, treating or ameliorating medical conditions, such as cancer, neurodegenerative
                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polypeptides and polynucleotides, useful for preventing, treating or ameliorating medical conditions, such as cancer, neurodegenerative disorders, lymphoid cell disorders, bone degenerative disorders,

This sequence is encoded by an extended human secreted protein coding sequence of the invention. The secreted proteins can be used in treating or controlling a wartety of human conditions. The secreted proteins may act as cytokines or may affect cellular proliferation or differentiation or may act as immune system regulators, haematopoiesis regulators, tissue growth regulators, regulators of reproductive hormones or cell movement or have chemotactic/chemokinetic, receptor/ligand, anti-inflammatory or tumour inhibition activity. The DNAs can be used in forensic procedures to identify individuals or in diagnostic procedures to identify individuals or in diagnostic procedures to identify individuals to the extended cDNAs. They are also useful for constructing a high resolution map of the human chromosomes. They can also be used for gene therapy to control or treat genetic diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to novel isolated human polynucleotides and the encoded proteins thereof. Specifically, it refers to proteases, kinases, phosphatases, secreted and transmembrane proteins, as well as the derived complete fragments, which can be used to develop antibodies and screen for peptide fragments, which can be used to develop antibodies and screen for comall molecule agonists and antagonists that can modulate their activities. The present invention describes polypeptides, preventing activities. The present invention describes polypeptides, preventing and treating proliferative disorders, e.g. cancer, disorders of and treating proliferative disorders, e.g. cancer, disorders of haematopoiesis such as thrombosis and anaemia, cardiovascular disorders, e.g. is asthma, pneumonia or cystic fibrosis, disorders of the kidney and urinary tract, e.g. chromic renal failure and glomerulopathy, diseases, e.g. HIV infection and system clupus erythematicsus, disorders of the endocrine system, e.g. diabetes mellitus, central nervous system disorders, e.g. epilepsy, altheimer's disease or amyotropic lateral contingential disorders, e.g. psoriasis, they exhibit many various conting in antibuding cytostatic, anticoagulant, thrombolytic anticoagulant, an

human secreted proteins expressed sequence tags (ESTs) for human secreted proteins expressed in prostate, and encode the proteins contains a secreted proteins expressed in prostate, and encode the proteins given in AAY11716 to AAY11931 respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The products of a secreted human gene concleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation and differentiation activity, hemmatopies regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, receptor/ligand activity, anti-inflammatory continuous inhibition activity, and chromosome mapping procedures.

The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acidic encoding the signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell
          reproductive hormone regulation; chemotactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated prostate-derived nucleic acids - used to develop products which may have cytokine, immune regulatory, haematopoiesis regulating, anti-inflammatory or tumour inhibition activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 MEHYRKAGSVELPAPSPMPQLPPDTLEMRVRDGSKIRNLLGLALGRLEGGSARHVVFSGS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human cDNA sequences that encode human secreted proteins. The invention also relates to an antibody that specifically binds to a polypeptide of the invention and a method of binding the polypeptide to an antibody. The polymucleotides are useful for expressing the entire secreted proteins which they encode and for distinguishing them tissues and cells from non-human tissues and cells, and for distinguishing between human tissues and cells, and for the polymucleotides comprising the CDNAs. The polymucleotides and the polymucleotides comprising the CDNAs. The polymucleotides and cells that do or do not express to olympoptides are useful in forensic procedures or disquestive individuals with genetic diseases resulting from abnormal expression of the genes corresponding to the cDNAs. The sequences are also useful in gene therapy to control or treat genetic diseases. This sequence represents a human secreted polypeptide of the invention. Note:

The sequence data for this patent did not form part of the printed plant and plant was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide encoding secreted polypeptide, useful for gene therapy, or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal expression of the genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MEHYRKAGSVELPAPSPMPQLPPDTLEMRVRDGSKIRNLLGLALGRLEGGSARHVVFSGS 60

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppeassant and cyrostatic activity. The polymucleotides are useful in gene therapy. A composation containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous is system, such as peripheral nervous system diseases, such as localised neuropathies and central nervous system disease, such as alzehier's, Parkinson's disease, Huntingron's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the activities such as: Immune system suppression, activity, chemotectic/chemokinetic activity, chemotectic/chemokinetic activity, haemostatic and thrombolytic activity, architits and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                    Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 MEHYRKAGSVEL-----PAPSPMPQLPPDTLEMRVRDGSKIRNLLGLALGRLEGG 50

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a polypeptide encoded by one of a large number of prepared from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8-JUN-1999
     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), processed DNA ABB72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
This invention relates to a novel method for altering one or more plant characteristics. Specifically, it refers to identifying genes that are up characteristics. Specifically, it refers to identifying genes that are up can regulated in transgenic plants overexpressing the heterodimeric STRAJDPa transcription factor of Arabidopsis and using these sequences to alter plant characteristics accordingly. The present invention describes consymmes, therapeutics, plants for the production of growth regulators, chrzymes, therapeutics, pharmaceuticals and animal feed products, where the altered plant characteristics are selected from increased yield or biomass, enhanced survival capacity, stress tolerance, plant architecture or physiology, altered endoreduplication, biochemistry, signal cransduction, storage lipid mobilisation and/or altered photosynthesis, cach relative to the corresponding wild type plants. Accordingly, these sequences can also be useful as positive or negative selectable markers during transformation of cells or tissues. The identified genes play a cole in a variety of biological processes such as DNA replication, cell cranscription factors. This polypeptide sequence is thate cress protein expressed by a gene upregulated 1.3 fold or more in plants overexpressing conversing the EzganDpa transcription factor, given in an exemplification of the

Claim 1; SEQ ID NO 78; 134pp; English.

This invention relates to a novel method for altering one or more plant characteristics. Specifically, it refers to identifying genes that are up characteristics. Specifically, it refers to identifying genes that are up CC - or down-regulated in transgenic plants overexpressing the heterodimeric EZRa/DPa transcription factor of Arabidopsis and using these sequences to alter plant characteristics accordingly. The present invention describes companies, theraspeutics, pharmaceuticals and animal feed products, where can suppose the altered plant characteristics are selected from increased yield or biomass, enhanced survival capacity, stress tolerance, plant architecture or physiology, altered endoreduplication, biochemistry, signal cransduction, storage lipid mobilisation and/or altered photosynthesis, cach relative to the corresponding wild type plants. Accordingly, these sequences can also be useful as positive or negative selectable markers during transformation of cells or tissues. The identified genes play a cole in a variety of biological processes such as DNA replication, cell corresponding and/or carbon metabolism or they function as transcription factors. This polypeptide sequence is thale cress protein carbon and contaction of the EZFa/DPa transcription factor, given in an exemplification of the invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 13, Al

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 23012, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: ARENGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: NUMBER: US/09/252,991A

CURRENT PILING DATE: 1999-02-18

PRIOR PLILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-07-27

NUMBER: OF SEQ ID NOS: 33142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         156 EYFITANDVKÇGKPHPEPYL------KGRNGLGFPINEQDPSKSKVVVPEDAP 202
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  229 ADSPALPVQQPEQHRQPDRAGPAEGRACGAGPVRPVPG-----QPGEARHFSFLGGGTG 282

Patent No. 6380370

GENERAL INFORMATION:
FALL SPECIAL SEQUENCES RELATING TO STAPHYLOCOCCUS

TITLE OF INVENTION: BPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: BPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS

FILE REPERENCE: GTC-007

CURRENT PELING DATE: 1998-08-13

PRIOR FILING DATE: 1997-11-08

PRIOR FILING DATE: 1997-11-08

PRIOR FILING DATE: 1997-08-14

NUMBER OF SEQ ID NOS: 5674

LENGTH: 482
                                                                                                                                                                                                                                                                                                                                                                                     LOCATION: (86)
